

# Prices of dwellings in housing companies

2014, August

## Prices of dwellings in housing companies fell slightly in August

According to Statistics Finland's preliminary data, prices of dwellings in old blocks of flats and terraced houses went down by 0.2 per cent in the whole country from July to August. In Greater Helsinki, prices went up by 0.8 per cent, but in the rest of Finland they went down by 1.0 per cent. Compared with the corresponding period of the previous year, prices fell by 1.1 per cent in the whole country. In Greater Helsinki, prices went up by 0.6 per cent from the year before, but in the rest of Finland they went down by 2.5 per cent.

### Development of prices of old dwellings in housing companies by month, index 2010=100

\*Preliminary data for the year 2014

In August 2014, the average price per square metre of an old dwelling in a housing company was EUR 2,201 in the whole country, EUR 3,494 in Greater Helsinki and EUR 1,694 elsewhere in the country.

When the monthly statistics on prices of dwellings in housing companies are published, they cover approximately 40 per cent of all transactions made in the latest statistical month. The monthly data become

revised during the following months so that the final data for the year are published in the release concerning the first quarter of the following year. Further information about data revisions can be found in separate tables.

## Revisions in these statistics

The data of the statistics have become revised according to the tables below. For more information about data revisions, see section 3 of the quality description.

### Revisions to data on monthly changes in prices of dwellings in housing companies, monthly statistics<sup>1)</sup>

Area and reference time		Monthly change, %		Revision, percentage point
		Latest release 29.9.2014	1st release	
Whole country	04/2014	-0,2	-0,9	0,7
	05/2014	-0,2	-0,7	0,5
	06/2014	0,3	-0,1	0,4
	07/2014	-0,7	-1,6	0,9
Greater Helsinki	04/2014	0,2	-0,6	0,8
	05/2014	-0,7	-0,8	0,1
	06/2014	0,6	0,1	0,5
	07/2014	-1,0	-1,4	0,4
Rest of the country	04/2014	-0,6	-1,3	0,7
	05/2014	0,2	-0,6	0,8
	06/2014	0,1	-0,2	0,3
	07/2014	-0,4	-1,7	1,3

1) The 1st release refers to the time when data for the reference period were released for the first time. The revision describes the difference of monthly change percentages between the latest and first release.

### Revisions to data on annual changes in prices of dwellings in housing companies, monthly statistics<sup>1)</sup>

Area and reference time		Annual changes, %		Revision, percentage point
		Latest release 29.9.2014	1st release	
Whole country	04/2014	0,0	-0,7	0,7
	05/2014	-0,9	-1,5	0,6
	06/2014	-0,8	-1,4	0,6
	07/2014	-0,4	-1,4	1,0
Greater Helsinki	04/2014	0,8	0,0	0,8
	05/2014	0,9	0,5	0,4
	06/2014	0,2	-0,2	0,4
	07/2014	0,6	0,0	0,6
Rest of the country	04/2014	-0,7	-1,2	0,5
	05/2014	-2,3	-3,1	0,8
	06/2014	-1,6	-2,3	0,7
	07/2014	-1,3	-2,6	1,3

1) The 1st release refers to the time when data for the reference period were released for the first time. The revision describes the difference of yearly change percentages between the latest and first release.

# Quality Description: Prices of dwellings in housing companies

## 1. Relevance

### 1.1 Information content and purpose of use

The statistics on Prices of dwellings in housing companies describe the unencumbered prices per square metre of old dwellings in housing companies, and monthly, quarterly and annual changes in them. For new dwellings data will be published quarterly and annually. The statistics contain data classified by area and type of building for the examined month and for a longer time period. The purpose of the statistics is to provide information about price development on the housing market.

### 1.2. Concepts, classifications and data

#### **The data and the data suppliers:**

*Old dwellings:* The data of the statistics on dwelling prices are based on the price information gathered by the Finnish Tax Administration for asset transfer tax calculation purposes. Additionally, the Tax Administration's Register of Real Estate Property and Statistics Finland's data on the dwelling stock that are based on the Population Register Centre's Register of Buildings and Dwellings are also used for the statistics.

*New dwellings:* The data of the statistics on dwelling prices are based on the information Statistics Finland receives via a private price monitoring service about transactions in new dwellings made by the largest real estate agents and building contractors. The monthly statistics do not contain information on new dwellings due to the scarcity of statistical data.

#### **Used concepts:**

*Dwelling:* A dwelling refers to a room or suite of rooms that is equipped with a kitchen, kitchenette or cooking area and is intended for year-round habitation.

*Price per square metre of dwelling:* The statistics are compiled from data on unencumbered prices, in other words, prices inclusive of the debt portion. The published price concept is price per square metre (EUR/m<sup>2</sup>).

*Floor area of dwelling:* The floor area (m<sup>2</sup>) of a dwelling is calculated from the inner surfaces of the walls enclosing it. The floor areas of auxiliary spaces (utility space, walk-in wardrobe, etc.), bathroom, hobby room, fireplace room, sauna in dwelling, washroom and changing room, and rooms used as working space if no hired employees work in them are also included in the floor area of a dwelling. Garage, cellar, sauna space in unoccupied basement, unheated storage space, balcony, porch, veranda, vestibule and unoccupied attic space are not included in the floor area of a dwelling.

*First home:* First-time dwelling transactions include those that are entitled to the exemption from the asset transfer tax for first-time homebuyers ([www.vero.fi](http://www.vero.fi)).

*Old/new dwelling:* An old dwelling refers to a dwelling that has not been completed in the examined year or the year before it. Respectively, a new dwelling refers to a dwelling completed in the statistical reference year or the year before it that is sold for the first time.

*Type of building:* The dwellings in the statistics are classified into blocks of flats and terraced houses according to type of building. The data on terraced houses also include detached houses whose tenure is based on ownership of housing company shares.

*Type of financing:* Dwellings financed with ARA subsidised housing loans and price controlled HITAS dwellings are not included in the non-subsidised dwelling category used in the statistics.

*Number of rooms:* A room is defined as a space with one or more windows that has a floor area of at least seven square metres and mean height of at least two metres. A hall, porch, bed recess or other similar space is not regarded as a room. Kitchen is not included in the number of rooms. Dwellings with at least

three rooms are classified into room number category 3h+. In the monthly statistics data are not published by number of rooms due to the scarcity of statistical data.

*(Nominal) price index:* Describes the change in prices compared to the base period of the index concerned. In the annual and quarterly indices the base periods are for old dwellings 2005, 2000, 1983 or 1970 and for new dwellings 2005, in the monthly index the base period is 2010.

*Real price index:* Describes the change in real prices compared to the index base period. In the annual and quarterly indices the base periods are for old dwellings 2005, 2000, 1983 or 1970 and for new dwellings 2005, in the monthly index the base period is 2010. The real price index is derived by dividing the point figure of the nominal price index for the area with the point figure of the Consumer Price Index for the whole country in the corresponding time period and base year.

*Distribution parameters:*

Q1 (lower quartile) = 25% of the observations remain below.

Med (median) = Middle observation when the observations are arranged in size order.

Q3 (upper quartile) = 75% of the observations remain below.

### **Classifications:**

*Annual and quarterly statistics:*

*Regional division, old dwellings:* The statistics use diverse area combinations, such as Greater Helsinki Area, satellite municipalities around the Greater Helsinki Area, regions and urban sub-areas. The Greater Helsinki Area comprises Helsinki, Espoo, Vantaa and Kauniainen, which in statistics is included in Espoo. The satellite municipalities are Hyvinkää, Järvenpää, Kerava, Kirkkonummi, Nurmijärvi, Riihimäki, Sipoo, Tuusula and Vihti. Regions are defined according to the decision of the Council of State. The urban sub-areas are formed of postal code areas using price level and location as the criteria. Details of the used regional classifications are appended to this publication and can be found on Statistics Finland's website.

*Regional division, new dwellings:* Due to the low number of transactions, the statistics on the prices of new dwellings are compiled according to a less detailed regional division than the statistics on the prices of old dwellings. The classification used in the statistics on the prices of new dwellings also takes into consideration the needs of the Consumer Price Index, hence the regional classification uses the division into major regions. The area categories are Whole country, Greater Helsinki, Rest of Finland (the same as with old dwellings, Whole country exclusive of Greater Helsinki), Rest of Uusimaa (exclusive of Greater Helsinki) and major regions Southern Finland, Western Finland, Eastern Finland, and Northern Finland.

*Monthly statistics:*

Regional division: The area categories are: Whole country, Greater Helsinki, Rest of Finland (Whole country exclusive of Greater Helsinki), Satellite municipalities (Hyvinkää, Järvenpää, Kerava, Kirkkonummi, Nurmijärvi, Riihimäki, Sipoo, Tuusula, Vihti), Helsinki, Espoo-Kauniainen, Vantaa, Tampere, Turku, Oulu and major regions Southern Finland, Western Finland, Eastern Finland, and Northern Finland.

## **2. Methodological description**

The statistics on the prices of dwellings in housing companies describe the unencumbered prices per square metre of dwellings in housing companies and changes in them. The statistics include both unencumbered prices per square metre calculated as averages directly from the data and the price index for dwellings in housing companies that describes the change in prices.

The price index aims at answering the question how much more or less a typical dwelling in a housing company now costs compared with before on the basis of the total number of actual transaction prices. Because the composition of dwellings sold at different times is not the same, monitoring average price changes is not sufficient. For example, the relative shares of different types of dwellings among sold dwellings may vary from quarter to quarter. When calculating the index, the so-called hedonic method is used, where the aim is to separate the genuine price development from price changes caused by dwelling characteristics at different points in time with the help of data classification and regression analysis.

**Classification:** Because the location, type of building and number of rooms are the most important price determinants, the composition of sold dwellings is first standardised by classifying these variables. The regional classification has been constructed so as to be geographically meaningful and as homogeneous as possible in respect of price levels of dwellings. In the regional classification, larger cities have been divided into several sub-areas and smaller municipalities, where only few transactions take place, have been combined. Within areas, dwellings in a housing company are divided by type of building into two categories: blocks of flats and terraced and detached houses. Dwellings in blocks of flats have been classified further by the number of rooms into one-room dwellings, two-room dwellings and dwellings with three or more rooms. Terraced houses have been divided by the number of rooms into two categories: dwellings with fewer than three rooms and dwellings with at least three rooms.

**Regression model and quality adjustment:** The used classification does not, however, homogenise the data sufficiently, because inside a class, dwellings differ from another in terms of micro-location, floor area, year of completion, and so on. The price data on old dwellings contain data on the year of completion, floor area, and location of the dwelling on the postal code level. The price data on new dwellings include data on the floor area and location of the dwelling on the postal code level. With the help of the regression model, these data are used to quality adjust for changes in the composition of the data between the base and reference periods.

An example of a quality adjustment: during the statistical quarter the dwellings in a certain area have, on average, a larger floor area than the dwellings in the base period. In the quality adjustment, the index is revised upwards as otherwise the lower price per square metre caused by the larger floor area would erroneously be interpreted as a drop in prices. If there is no difference in the floor areas of the dwellings sold during the statistical quarter compared to the base period, no quality adjustment is needed.

The index point figure for the whole country is derived by aggregating the index class-specific price changes and the quality adjustments with the so-called log-Laspeyres index formula. The weights for old dwellings are derived as value-shares of the stock of dwellings in housing companies in 2005. Respectively, the weights of new dwellings are the consumption expenditure weights of the dwellings purchased in 2005.

A more detailed methodological description has been published in Statistics Finland's Studies series (Koev, Eugen: Combining classification and quality adjustment in constructing a House Price Index. Helsinki, Statistics Finland, Studies series (2013)).

### ***3. Correctness and accuracy of the data***

#### ***3.1. Reliability of the statistics***

The statistics on the prices of old dwellings in housing companies are based on the Tax Administration's asset transfer tax data, which cover the transactions of all dwellings whose tenure is based on ownership of housing company shares. All transactions of old housing company dwellings are not included immediately in the statistics, because the purchaser is allowed two months to pay the asset transfer tax. Many purchasers pay the tax faster than this and in transactions intermediated by real estate agents the tax is paid at the time of transaction.

The statistics on the prices of new dwellings in housing companies are based on data obtained from the largest real estate agents and building contractors and the data are final when first published.

The statistics describe the housing company share market by area relatively reliably. However, the number of included transactions should be taken into consideration. If few transactions have been made, a couple of deviating cases may affect the average price for an area significantly.

#### ***3.2. Accuracy of the statistics***

Cases with missing information about transaction prices or floor area, or with exceptionally high or low price due to contract within family or error in data entry are not accepted into the statistics. The acceptable ranges of prices per square metre by area are defined yearly for old and new dwellings.

[The price data become revised](http://tilastokeskus.fi/til/ashi/rev_en.html) (http://tilastokeskus.fi/til/ashi/rev\_en.html) over the year so that the final data for the year are published in the release concerning the first quarter of the following year. On the average, the revision in monthly statistics on prices of dwellings in housing companies amounts to 0.3 percentage point either way for the whole country. The revision is larger for smaller geographical areas. The average revision in quarterly statistics amounts to 0.2 percentage point either way for the whole country.

### ***3.3. Use of the parameters of the statistics***

Because the price index takes into account changes in the distribution of year of completion, floor area and location of dwellings sold at different points in time, and their effects on prices, the average prices of the statistics vary differently from the price index. The price index and the average price are each useful measures for different situations.

The *price index* endeavours to measure as accurately as possible how much more/less an average dwelling in a housing company costs now than it did before. The *average price*, in turn, describes the prevailing price level for sold dwellings without considering whether they are older, newer, larger or smaller than dwellings sold before.

## ***4. Timeliness and promptness of published data***

### ***4.1. Publication frequency and measurement period of the statistics***

The statistics on prices of dwellings in housing companies are published monthly, quarterly and annually. Monthly data are released one month from the end of the statistical reference month and quarterly data are released simultaneously with the data for the last month of each quarter. Quarterly data are statistically more reliable than monthly data and contain more detailed information by area. The annual statistics are published in connection with the statistical release for the first quarter of the year following it.

### ***4.2. Preliminarity of the statistics***

When the statistics are published they cover approximately two-thirds of all transactions made in the latest quarter. The latest monthly statistics contain around two-fifths of all transactions. Statistics Finland receives the data on the remainder as they arrive at the Tax Administration.

Monthly and quarterly data are updated retrospectively in connection with each release so that the final data for the statistical year are published with the data for the first quarter of the year following it.

## ***5. Accessibility and transparency of the data***

A latest statistical release will be published from the statistics on Statistics Finland's web pages on the publication date of the statistics on prices of dwellings. Data concerning dwelling prices can also be found on Statistics Finland's web pages and database service. The essential metadata have been described in this document, which is incorporated into the publication of statistics on dwelling prices in housing companies. This document is also available on Statistics Finland's web pages.

These statistics cover only dwelling transactions in housing company shares. Especially out of the Greater Helsinki area, there are numerous real estate transactions that are not included in these statistics. Statistics Finland publishes a separate price index on real estate prices. Data on real estate transaction prices by municipality are available from the National Board of Survey.

## ***6. Comparability of the statistics***

### ***6.1. Comparability with other data***

When these statistics are compared with data from other producers the source of the basic data should be considered. Statistics Finland's data derive from the Tax Administration's comprehensive files, and thus cover exhaustively all completed transactions.

### ***6.2. Comparability over time***

Data compiled from the Tax Administration's asset transfer tax data are available on prices of old dwellings in housing companies quarterly starting from the year 1987. Older data are available going back to 1970. Data provided by real estate agents are available for the period 1970 to 1986 and the used classification is much less detailed. As regards new dwellings, the time series based on data provided by real estate agents have been calculated quarterly from 2005 onwards.

In January 2013, combinations of register data were updated. This increases the number of transactions by around three to five per cent on the annual level compared with earlier years.

## ***7. Coherence and consistency***

In addition to the statistics on prices of dwellings in housing companies, Statistics Finland releases quarterly statistics on real estate prices. Besides the data published by Statistics Finland, real estate agents, credit institutions and banks also publish information concerning dwelling prices and their development.
